Problem Statement:

Who is experiencing the problem: Less Fortunate Students

What is the problem: These less fortunate students are unable to afford books, and they
Should have a means to access them.

Where does the problem present itself: Outside of classrooms, in homes

Why does it matter: Reading outside the classroom is important to cognitive development which
some families don't have easy access to

Ideas for a problem:

- I like that idea
- If I'm presenting one I think maybe a problem focused on less fortunate kids like for
  example getting free pdf versions of books to kids that don't have the means to buy
  them, don't have a library card, etc. In today's day and age kids are going to grow up
  reading on ipad and phones anyways so they're more inclined to need online versions of
  books
- Sounds great! So would the problem be that users need more convenient access to
  materials for school, or would it be more focused on the books themselves?
- Hey i filled out some of the w's with the various pieces of info for our problem, feel free to
  change them or edit or whatever i just wanted to get something going. Maybe we should
  find a time where we can all get on the doc at once and discuss?
- I definitely agree we should all get on together!
- What specifically are we hypothetically going to make? The idea would be to create a
  code based innovation to solve the problem (except we won't actually make it) but I'm
  slightly confused on what we would be making.
    - I think we would be making a service that gives out free pdf books based on what
      grade level a child/their family that subscribes to the service is at. It could be like
      a weekly, automated service that emails pdf versions of books or it could be an
      app
    - I like the app idea, and I like the idea of it being a subscription based thing, so it's
      more specialized for what your particular needs are
